1	libgdtl Introduction	1
2	libgdtl API	3

BiDi, shaping and basic text layout for Godot Engine.

1.1 Dependencies

- Godot 3.1+
- C++14 compiler
- Meson build system (for gdnative module build only)
- SCons build system

1.2 Compiling (as builtin module)

1.2.1 Build options

Name	Description	Default value
<code>builtin_runtime</code>	Use the built-in libraries	true
<code>use_graphite2</code>	Enable SIL Graphite 2 complementary shaper	true
<code>use_font_wrapper</code>	Enable Godot font wrapper for default controls	false

If `use_font_wrapper` is enabled, apply `patch_font.diff` from the root of this repository to the Godot engine source first.

1.2.2 Building *libdgtl* module

Clone this repository (without `-recursive` flag) into Godot's `modules` subfolder as `godot_tl`. Rebuild Godot engine as usual.

1.3 Compiling (as gdnative module)

1.3.1 Build options

Name	Description	Default value
godot-cpp-lib-name	godot-cpp static library name (without <i>.a</i> or <i>.lib</i> extension)	libgodot-cpp
static-runtime	Link libraries statically for better portability	false
builtin-runtime	Use the built-in libraries	false
use-graphite2	Enable SIL Graphite 2 complementary shaper	true

1.3.2 Building *godot-cpp* static library

See <https://github.com/GodotNativeTools/godot-cpp/blob/master/README.md#compiling-the-cpp-bindings-library>

1.3.3 Building *libgdtl* module

You can compile this module by executing:

```
meson {Targer-Folder} -Dgodot-cpp-lib-name={Godot-CPP-Name} --buildtype=release
ninja -C {Targer-Folder}
```

2.14.6 Description

Note 1: Code points, Characters, Clusters and Glyphs

- A code point is a single encoding UTF-16 unit (Unicode character or half of the surrogate pair).
- A character is a full Unicode character.
- A grapheme cluster is the abstract unit of a writing system (a letter, a digit, or punctuation).
- A glyph is a shape used to render a character or a sequence of characters.

In general, code point, characters, clusters and glyphs do not have one-to-one correspondence.

Note 2: Encoding

TLShapedString uses UTF-16 encoding, all positions accepted and returned by TLShapedString function are measured in UTF-16 code points.
